BA Series

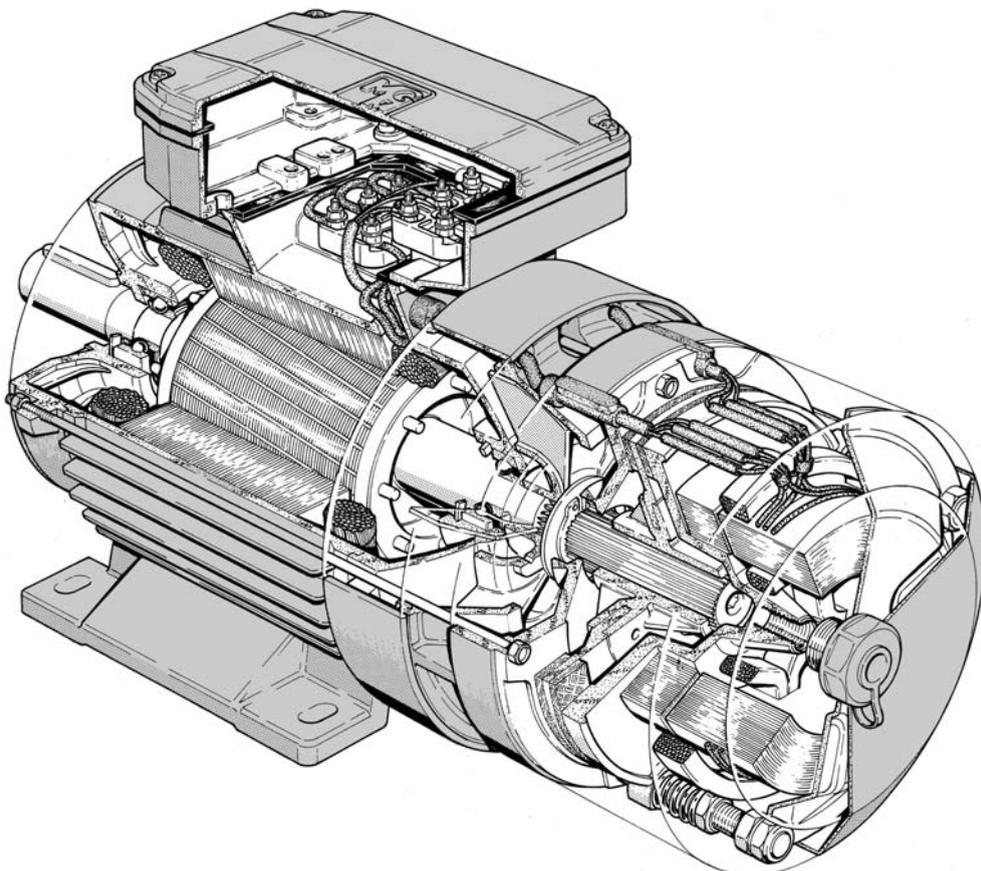

BA series consists of three phase, asynchronous brake motors totally enclosed fan cooled. BA series range starts from 71 up to 225 frame size. The motor brakes in case of power supply failure. The braking action is always secured through a very quick and precise stop assuring a safe and prompt stop in case of unintentional power supply failure. The brake torque remains the same in both directions of rotation and the motor brakes without shaft axial sliding. As a standard the brake is AC 3-phase voltage supply with brake leads connected with motor leads in a single terminal board while on request it is possible to supply the brake separately with a second terminal board or to have a DC brake supply with a built-in rectifier fitted inside the terminal box. The rectifier is provided with over-voltage and radio frequencies emission protection devices. BA series motors tolerate high overloading rate and are capable of withstanding overheating so as to guarantee the best reliability even under tough operating conditions. All MGM series motors have been designed to be controlled by inverters. The motor winding insulation is class F, while class H is available on request. Motor construction type is totally enclosed externally cooled and IP54 enclosure (IP55 and IP56 available on request). Motors up to 132 frame size are fitted as standard with a hexagonal hole on the shaft at the non drive end to allow manual rotation, even if power is off. All BA series motors are provided as standard with hand brake release screw.

BA series brake disc has a large lining surface that allows high brake torque, low disc wear and consequently low maintenance cost. The brake torque can be easily adjustable to the desired value just by screwing some nuts. Thanks to its special construction the brake friction surface is self-ventilated on the motor side, permitting a high brake workload and keeping brake time constant. The brake lining material is asbestos free.

BA series motor frame is made of die cast, light metal on motors up to 132 size and the terminal board box, provided with cable glands and plugs, is positioned 180° above the motor support feet. The frame is made of cast iron starting from 160 frame size and the terminal box is located on the right side (drive-end view). Shields and flanges are made of aluminium on motors up to 90 frame size, and of cast iron on motors of 100 frame size and above. As standard feet are frame integrated (they are not simply attached to the frame) on IM B3 mounting (foot mounted) making the motor very sturdy. This feature is very important for those applications where the motor is much stressed during the starts and stops.

The brake friction surfaces are made of cast iron as a standard. The brake moving element and the brake coil have a laminated nucleus to reduce electrical losses and to secure a very quick brake intervention.

BA series main features are its sturdy construction, quick braking action, constant braking time, high number of permissible start/stop cycles also under severe applications, easily adjustable brake torque, low maintenance costs.

BA series brake group

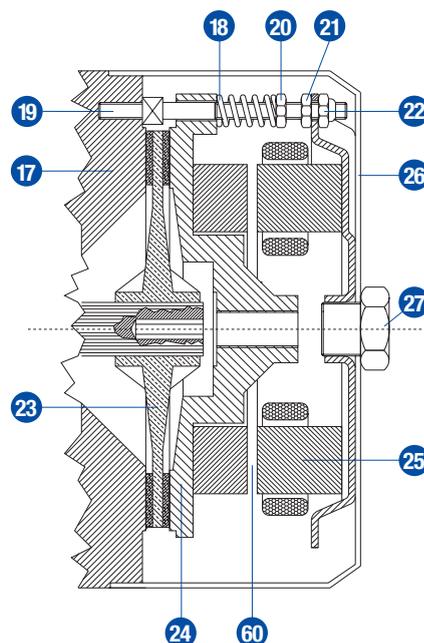

Air gap adjustment

The air gap (60), that is the distance between the two magnetic cores, the brake coil (25) and brake moving element (24), must stay within the value expressed in the chart below. It is not advisable to exceed the expressed value, in order to avoid vibrations of the brake moving element, very loud noise, the brake coil burning or even the whole brake assembly failure. It is advisable to check periodically the air gap because it increases as a consequence of the brake disc wear. In order to set the air gap to the indicated value, you have to loosen the nuts (21) (22) so to move the brake coil (25) towards the brake moving element (24). Once this operation has been settled be sure to tighten the locknuts.

Frame Size	71-80	90-100	112-132	160-200	225
Air Gap	0.25-0.5	0.3-0.6	0.4-0.8	0.5-1.0	0.6-1.2

Brake torque adjustment

The brake torque is proportional to the springs (18) compression, which can be adjusted tightening or loosening the locknuts (20). The compression of the three springs must be as even as possible. Once the brake is properly supplied, if the brake coil isn't able to attract the brake moving element with a quick stroke and to keep it attracted without any vibrations, check the air gap adjustment and, if this inconvenience still persists, loosen the locknut (20) by two threads and try again until the proper functioning is obtained. It is important to consider that some motors can be equipped with 3 springs and some others with 6. (see page 23). Once this operation is completed, check the brake torque to make sure it is set to the desired value. Never set the brake torque to a higher value than the one indicated on the motor nameplate.

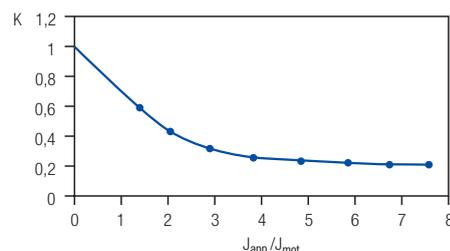

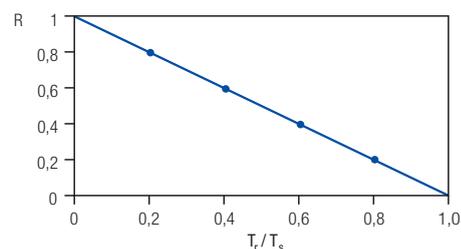

Permissible start frequency under load

The technical data tables provide the ideal no-load start frequency (Z_0). The permissible start frequency when an external load is applied (Z_{load}) can be found with the following formula:

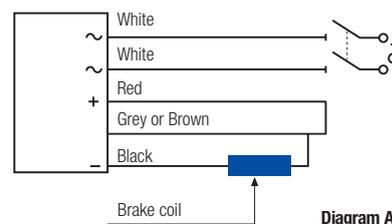

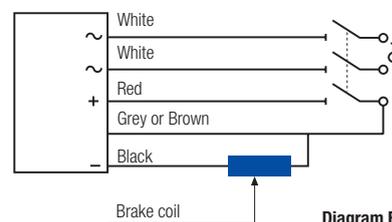

$$Z_{load} = Z_0 \cdot K \cdot R$$

where " Z_0 " is the table-value for the selected motor and " K " and " R " are factors determined by the curves on the side; the factor " K " is related to the ratio of the moment of inertia of the applied load (J_{app}) to that of the motor (J_{mot}) while the factor " R " is related to the ratio of the resisting torque (T_r) to the starting torque (T_s). This calculation gives an approximative indication only. If the required starting frequency is close to Z_{load} , it is advisable to use a motor equipped with thermal protectors. It is necessary to check the maximum energy dissipation limit of the brake group and the maximum motor RPM in those applications where high moment of inertia is involved. On request is available a special brake disc material capable to withstand very high dissipation energy. Please contact MGM technical staff for additional information.

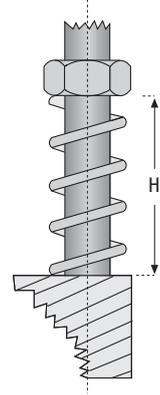

Brake coil wiring diagram

As standard BA series motors are equipped with AC brakes with single terminal board for the brake and the motor while on request it is possible to supply the brake separately. On request DC brakes are available for BA series with the rectifier located inside the terminal box. The rectifier is provided with over-voltage protection devices and with a RFI filter. MGM brake motors equipped with DC brakes can be connected as in diagram A or B according to the needed braking time. MGM motors provided with DC brake coil are connected as in diagram A. The DC brake coil has to be connected according to diagram B to have a reduced brake reaction time.

Diagram A

Diagram B

Brake torque and brake spring compression

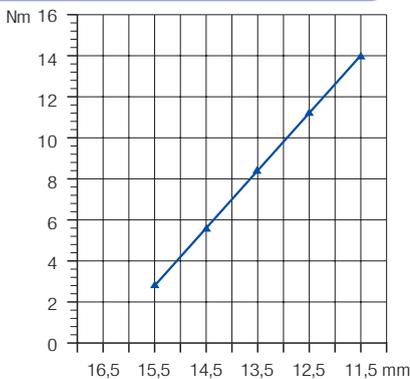

BA series motors are provided as standard with a brake torque set to 60 - 70% of the maximum admissible brake torque indicated on the nameplate. On request the motor can come already set to a specific brake torque value different from the standard one. The brake torque is shown in the diagrams here below as a function of the brake assembly spring compression. The shown values refer to BA series motors mounted in horizontal position with an AC brake coil. DC brakes have the same trend as AC brakes even if they have lower brake torque, as shown in the table below.

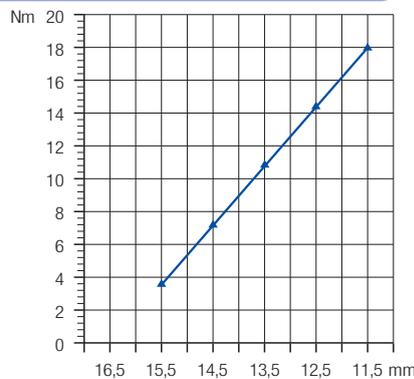

The values shown in the diagrams are only indicative as application conditions, brake lining wear and temperature, can affect the real brake torque. Whenever it is necessary to adjust the braking torque to a specific value it is advisable to directly measure the obtained brake torque after each brake torque adjustment. Consider that the motor mounting position influences remarkably the effective braking torque when low brake torque values are involved. Please contact MGM for further information.

* Non Standard Power

1. Motor characteristic values reported in the tables refer to continuous duty (S1), 50 Hz frequency, ambient temperature max. 40 °C, altitude up to 1000 m. above sea level operating condition.

2. DC brake is provided on request only on BA series motors. Brake current consumption values refer to a rated voltage of 3-phase 400V for AC

brakes and single-phase 230V for DC brakes.

3. The table shows the sound pressure noise level, measured at one metre range from the motor according to the Acurve (ISO 1680). The shown noise levels refer to motor no-load operating condition and should be regarded with a tolerance of ± 3dB.

4. Max brake torque and Z₀ values refer to AC brake. Go to pag. 23 for DC max brake torque values.

5. The rated torque T_n (Nm) for motors can be calculated as follow: $T_n \text{ (Nm)} = \frac{9,55 \times P_n \text{ (W)}}{\text{RPM}}$

1. Motor characteristic values reported in the tables refer to continuous duty (S1), 50 Hz frequency, ambient temperature max. 40 °C, altitude up to 1000 m. above sea level operating condition.

2. DC brake is provided on request only on BA series motors. Brake current consumption values refer to a rated voltage of 3-phase 400V for AC

brakes and single-phase 230V for DC brakes.

3. The table shows the sound pressure noise level, measured at one metre range from the motor according to the Acurve (ISO 1680). The shown noise levels refer to motor no-load operating condition and should be regarded with a tolerance of ± 3dB.

4. Max brake torque and Z₀ values refer to AC brake. Go to pag. 23 for DC max brake torque values.

5. The rated torque T_n (Nm) for motors can be calculated as follow: $T_n \text{ (Nm)} = \frac{9,55 \times P_n \text{ (W)}}{\text{RPM}}$

3. The table shows the sound pressure noise level, measured at one metre range from the motor according to the Acurve (ISO 1680). The shown noise levels refer to motor no-load operating condition and should be regarded with a tolerance of ± 3dB.

4. Max brake torque and Z₀ values refer to AC brake. Go to pag. 23 for DC max brake torque values.

5. The rated torque T_n (Nm) for motors can be calculated as follow: $T_n (Nm) = \frac{9,55 \times P_n (W)}{RPM}$

2. DC brake is provided on request only on BA series motors. Brake current consumption values refer to a rated voltage of 3-phase 400V for AC

brakes and single-phase 230V for DC brakes.

3. The table shows the sound pressure noise level, measured at one metre range from the motor according to the Acurve (ISO 1680). The shown noise levels refer to motor no-load operating condition and should be regarded with a tolerance of ± 3dB.

4. Max brake torque and Z₀ values refer to AC brake. Go to pag. 23 for DC max brake torque values.

5. The rated torque T_n (Nm) for motors can be calculated as follow: $T_n (Nm) = \frac{9.55 \times P_n (W)}{RPM}$

brake linings wear

Brake linings wear is mainly affected by the environmental conditions in which the motor operates, by the frequency of starts, by the energy dissipated at each stop and by the torque provided by the brake. The lining temperature rises with the braking frequency and with the moment of inertia applied to the shaft. When the lining temperature rises, the lining wear increases and consequently the braking time is longer. BA series motors are designed to have continuous cooling of the braking surfaces so as to reduce brake disc wear to have a shorter braking time.

The life cycle of the brake linings can be roughly expressed by the number of brake interventions and can be approximately calculated as follows:

$$n = W_{tot} / W_b$$

where W_b (J) is the work done during each braking action and W_{tot} (J) is obtained from the table for each type of brake motor. However, it is necessary to check the brake disc wear periodically to replace the brake disc before it is completely worn. If you want to estimate the interval between two successive air gap adjustment in a specific application, note that the brake linings wear is greater than usual during the run-in (a few thousands stops).

On PV series brake motors W_{tot} shown in the table have to be multiplied by 0.5 and the moment of inertia have to be calculated considering the presence of the fly-wheel. The indicative number of AC brake stops N_{intAC} between two successive air gap adjustments on a BA motor is given by the following formula:

$$N_{intAC} = E_{rBA} / W_b$$

while the N_{intDC} for DC brake motors is given by : $N_{intDC} = N_{intAC} \cdot 0.65$

	71	80	90	100	112	132	160	180	200	225
W_{tot} (MJ)	537	705	952	1148	1438	2255	3290	4355	4355	5226
E_{rBA} (MJ)	56	80	95	105	130	200	290	385	385	462

The indicative number of DC brake stops N_{intBM} between two successive air gap adjustments on a BM motor is given by the following formula:

$$N_{intBM} = E_{rBM} / W_b$$

E_{rBM} values are shown at pag. 39 (BM section).

Starting and braking time

Starting current for an asynchronous motor is always much higher than the nominal current. When the starting time is excessively long, there are electromechanical disturbances and higher temperatures on winding, damaging the motor. For information on maximum starting time allowed for each type of motor, please contact MGM. An indicative value for starting time t_s (expressed in seconds) and the angle of rotation φ_s (expressed in radians) can be obtained as follows:

$$t_s = \frac{(J_{mot} + J_{app}) \cdot n}{9.55 (T - T_{load})} \quad \varphi_s = \frac{t_s \cdot n}{19.1}$$

Where J_{app} (Kgm^2) is the moment of inertia referred to the motor shaft, M_{load} (Nm) is the opposing torque to the motor, J_{mot} (Kgm^2) is the moment of inertia of the motor, n (RPM is the rated motor RPM), T is the average starting torque, $T=(0,8 \div 0,9)T_s$ (see the technical data table for J_{mot} , n and T_s of the selected motor).

An indicative braking time t_f (s) can be calculated as follows: $t_f = \frac{J_{tot} \cdot n}{9.55 (T_b \pm T_{load})} + \frac{t_B}{1000}$

Brake electrical reaction time t_B (ms)

Motor Type	AC Brake	DC Brake (Standard)	DC Brake (Quick)
BA 71-80-90	7	80	20
BA 100-112	9	80	30
BA 132-160	12	85	30
BA 180-200	12	90	30
BA 225	14	100	35

Where: J_{tot} total moment of inertia at the motor shaft (Kgm^2)
 n motor RPM (min^{-1})
 T_b brake torque (Nm)
 T_{load} resisting load torque (Nm) with + sign if matches the brake torque, or - sign if opposite.
 t_B brake electrical reaction time (ms)

The reported t_B times are valid only if the motor is connected with the brake. In case the brake is supplied separately, the t_B time has to be cut by 30 – 50%. This calculation gives an approximative indication. Please contact MGM for further information.

* 225S-225M 2 poles D=55, E=110

Notes: QBAF is the Q dimension for BAF series

QBAPV is the Q dimension for BAPV series

Cable glands are M 20 on size 71 up to 80

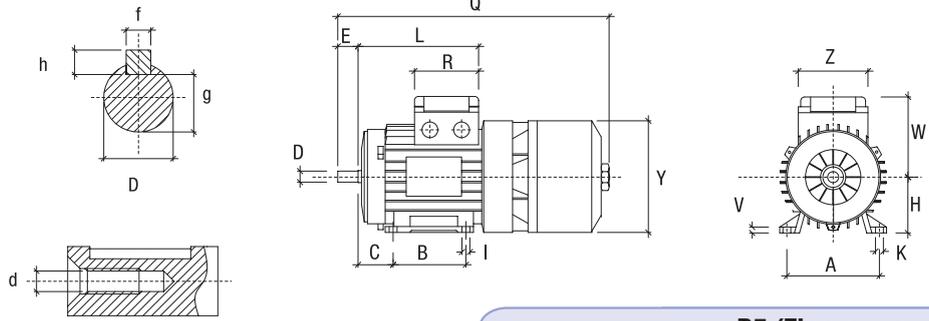

M 25 on size 90 up to 112

M 32 on size 132

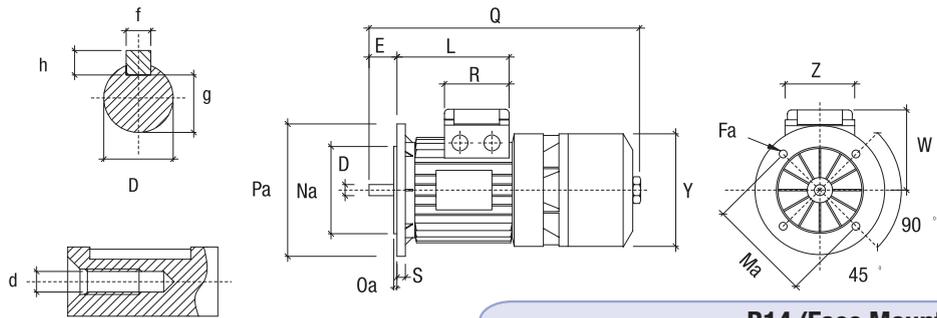

PG 29 on size 160 up to 200

M 50 on size 225

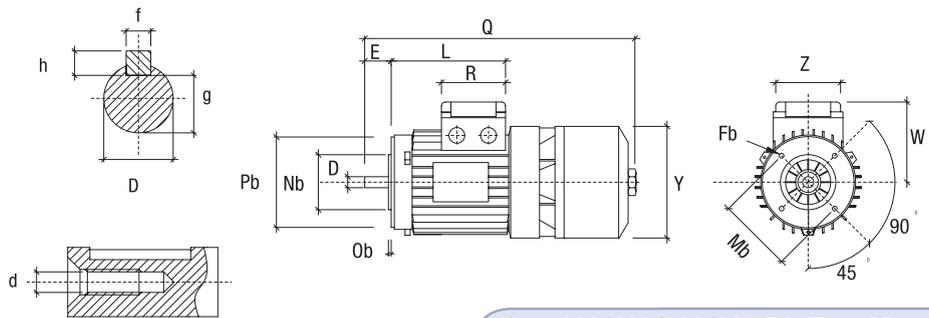

B3 (Foot Mounting)

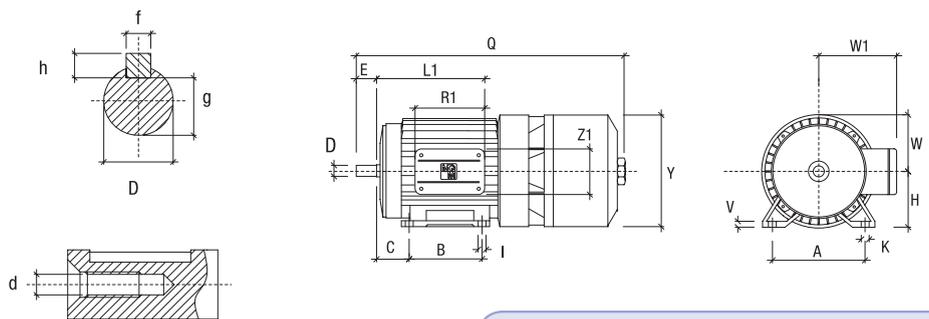

B5 (Flange mounting)

B14 (Face Mounting)

Size 160/180/200/225 B3 (Foot Mounting)

Double Terminal Board Box
